

DEM Now Available in SHP Format

May 2007

AltaLIS is pleased to announce the release of two new file formats for our DEM product. Traditionally available only in an ASCII format, this elevation data is now available in **ESRI's SHP format** in 1:20K NTS map sheets as well as one contiguous provincial dataset in **ESRI's GRID format** for provincial subscribers.

The DEM contains the original photogrammetrically captured elevation points for the provincial DEM and is separated into three categories; mass points, hard breaklines and soft breaklines. Mass points include all spot elevation points that are not part of a breakline, hard breaklines include cliffs and bodies of standing water and soft breaklines include all other hydrographic features.

The price of the DEM data was reduced to \$25 per map sheet in January 2006 so now you can obtain the accuracy of Aerial Photography for approximately 11¢ per km².
